Professional Chromira Prints
Digital Print Ready (File Dump) Instructions

Step 1:

Open your application
We use Adobe Photoshop, yet Elements or Lightroom can be used.
Please be aware that unless your colour settings are setup to our requirements
and your monitor properly colour balanced your images could look different on screen
verses printed. We are happy to supply you with a monitor test file and sample print
generated from this file for you to check your monitor calibration.

Step 2:

Go to - file - New
Set up your new file as specified below:
Name: "filename".tif
Preset size: Custom
Width: 30 inches
Height: 20 inches
Resolution: 300 pixels/Inch
Mode: RGB Colour, 8bit

Step 3:

Go to - File - Open.Find the file(s) you want printed. Select and open them.If you
require your files to be a certain size it is best to pre-size them before you place
them onto your file dump page.
With the first or largest image that you would like to print open, select the Move Tool
from you Toolbar.Click and hold on your image, drag it onto your 20x30in file dump.
With your first image on your file dump page you can reposition and rotate your
image to suit. To be sure of the size and proportion of you image use your rulers
and guides.When you have positioned your first image suitably, repeat the operation
on your next image until your File dump page is full.

Step 4:

With no further editions to be made now is the time to flatten your file.
To do this (In Photoshop) select Layer - Flatten image.
Now you are unable to move your images individually.
Your file size will now be approximately 154.5mb.
Save your File dump as a TIF or JPEG.

Your Digtal File dump is now ready for printing.
This file is generally too large to email, so copy to a CD/DVD, USB/Memory stick,
or send to us via a file transfer website eg:
www.dropbox.com
www.hightail.com
If using these please send them to **digital@kens.co.nz**, where we will reply via email
 to confirm we have received your file safely.
